

Project Overview

This one-year project scope is designed for the development and enhancement of an AI-powered brainwellness ecosystem under the umbrella of “Cognidolph”. The focus is on building practical neuroscience-based digital solutions for stress management, emotional intelligence enhancement, brain training, habit formation, and user engagement.

The scope is divided into two independent but collaborative teams:

- AI-Powered Mentorship, Cognitive Fitness & Emotional Intelligence Development Platform
- Human Experience & Cognitive Research

The project combines:

- AI coaching systems
- Brain wellness mobile/web products
- Emotional intelligence tools
- Stress assessment systems
- Online brain gym experiences
- Gamified relaxation systems
- User feedback and field validation
- Product optimization through research and testing

The technology stack will primarily include:

- Node.js (Backend APIs and AI services)
- Flutter (Android/iOS application)
- React.js / Next.js (Website and web app)
- MongoDB / PostgreSQL
- Firebase
- OpenAI APIs / LLM integrations
- WebSocket / Real-time systems
- AWS / DigitalOcean / GCP
- Analytics and testing tools

Team Objective

To validate product effectiveness, improve user experience, conduct testing and field trials, collect insights, and optimize engagement and impact.

Team 2 Core Responsibilities

1. Research & Neuroscience Validation

Scope Includes

- Reviewing neuroscience and psychology literature
- Validating exercises and assessments

Consulting psychologists/neuroscientists
Benchmarking global mental wellness products
Building evidence-backed intervention systems
Reviewing emotional intelligence frameworks
Evaluating stress reduction effectiveness

2. Client Interviews & User Research

Conduct structured interviews with users and stakeholders.

Stakeholders

Students
Competitive exam aspirants
Working professionals
Startup founders
Business owners
Teachers
HR professionals
Coaches and psychologists
